DETAILED ACTION

Claim Rejections - 35 USC § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 22-26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Cooper in view of Satterthwaite.

Cooper discloses an air gap baffle sealing system in a generator having a stator and a rotor. The sealing system comprises at least one ring 47 attached to the stator 13. The other ring 47 can be considered an access portion. The baffle seal 50 is sandwiched between the two rings 47 and could be replaced or repaired without requiring the removal of the rotor. Cooper does not disclose that the parallel ring has a channel for receiving a seal having a hollow portion that can extend the seal from a non-sealing position to a sealing position when filled with a medium.

Satterthwaite teaches an adaptable seal that can attain a sealing and non-sealing position between a stator and rotor. Satterthwaite teaches that using such a seal eliminates precise dimensioning requirements and is capable of achieving a varied degree of sealing. Satterthwaite also teaches mounting the seal in a housing (figs. 1 or 5) comprising two halves. The seal is received in a channel in at least one of the rings. The other ring can be considered an access portion. The seal has a hollow portion that can be filled with a medium, such as gas, to expand the seal to its operation (sealing) orientation. Therefore, it would have been obvious for one of ordinary skill in the art at the time the invention was made to modify the sealing system of Cooper by using the

Art Unit: 3676

channel and inflatable seal taught by Satterthwaite to provide an effective seal that can be adapted between a service or non-sealing position to allow a varied degree of sealing as well as being easier to make and install.

Response to Arguments

3. Applicant's arguments with respect to the claims have been considered but are unpersuasive. Both Cooper and Satterthwaite disclose a seal sandwiched between mating halves. The rings 47 of Cooper can be considered the access and the parallel ring. Coopers sealing assembly allows the seal to be repaired or replaces without removing the rotor. Satterthwaite teaches an adaptable/inflatable seal.

Conclusion

4. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.
